

YOUR BRIEF, DELIVERED

The bar you set, met and passed.

You gave one clear benchmark: at least the quality of medfin.ai, with interactive infographics throughout for engagement. Here is exactly how the build answers it, measured against that site.

The short version: it **meets the medfin.ai standard, and in several places goes past it**, most of all on the interactivity. Here is the honest comparison.

Measured against medfin.ai

Smooth, weighted scrolling	medfin: its signature feel, the page glides rather than jumps. Yours: the same class of smooth-scroll engine , tuned by hand, with every animation locked to that scroll.
A story told through scroll	medfin: its "chaos to clarity" moment, cards scatter then resolve. Yours: your practice's frustrations scatter and collapse into a single "Help", then reframe. It is about the owner, not a software dashboard, so it lands harder.
Stacking cards	medfin: benefit cards that stack as you scroll. Yours: your six real numbers stack and count up as each one lands . Proof, not features.
Interactive infographics throughout	medfin: graphics that mostly play on scroll. Yours: several moments that respond to the visitor , the exact engagement you asked for. More overleaf.
Confident type and restraint	medfin: big, clean, confident type. Yours: the same confidence, with headlines that rise into place line by line.
Under the surface	medfin: built on Webflow, a template platform. Yours: custom coded on modern professional tooling . It loads faster, and it is yours to own outright, with no monthly platform rent.

WHAT HAS BEEN BUILT

Under the surface.

What you can see on each section, and the craft sitting underneath it that makes it feel the way it does.

The signature moment: your practice, converging

As you scroll into the "Your Practice" section, the page locks in place and plays a sequence. Ten frustrations, in a practice owner's own words, scatter across the screen, then collapse inward into a single word, "Help", before the message reframes: this is not a dentistry problem, it is a business problem.

UNDER THE HOOD A pinned, scroll-linked timeline. The section is held fixed while a tall stretch of page scrolls through it, and every card's position, rotation and scale is tied to your exact scroll position. The cards scatter proportionally tighter on smaller screens so nothing spills. This is the single hardest interaction on the site.

Your numbers, stacking into proof

In My Story, your six real figures (turnover, team, clinicians, surgeries, new patients, Google rating) build into a physical stack. Each card slides up, locks into place, and the number counts up from where you started to where you finished, before the next card covers it and leaves just a sliver of the last one showing.

UNDER THE HOOD Built on native browser "sticky" behaviour rather than a faked animation, which is why it feels solid and never stutters. Each number counts up once, the moment it arrives, using even-width figures so the digits do not jump as they tick. The pause on each card was tuned by hand, screenshot by screenshot, until every number settles before the stack moves on.

A hero that earns the first three seconds

The headline rises into place line by line, and just beneath it a short sequence plays as you scroll, striking through "good" and underlining "better" so the point lands with weight rather than being simply read.

UNDER THE HOOD A clip reveal, where each line rises from behind its own edge, plus a second scroll-linked timeline that draws the strikethrough and the underline in time with your scroll.

A navigation bar that responds to you

The top bar floats clear of the edges, sits invisible over the hero, then turns solid as you begin to scroll. Hover across the menu and a soft highlight glides from one item to the next.

UNDER THE HOOD The colour, border and shadow shift live as you scroll rather than flicking on and off, and the sliding highlight is a shared-element animation that moves itself between items with no manual positioning.

Engineered, not assembled

Behind the visible design sits a proper system. One consistent set of colours and type is used everywhere, so nothing drifts as the site grows. It respects visitors who prefer less movement: every animation has a calm, still fallback, so it stays comfortable and accessible for everyone. And it loads fast, with no content jumping around as the fonts arrive.

UNDER THE HOOD A shared set of design tokens across the whole site, a reduced-motion path on every animated section, and a fix that re-measures the page once the fonts have settled so the scroll animations always read correctly. That last one was a real bug, found and solved during the build.

What it is built on

The same professional tooling behind top modern sites. Each piece is here for a reason, not for show.

Next.js and TypeScript	The framework and language behind fast, reliable, search-friendly modern sites. The foundation everything else sits on.
Tailwind CSS	Used to build a bespoke design system for your site specifically, rather than a theme shared with everyone else.
GSAP and ScrollTrigger	The motion engine behind the pinned, scroll-linked sequences: the convergence and the hero reframe.
Lenis	The smooth-scroll engine that gives the whole site its weighted, glide-not-jump feel, synced to the animations.
Framer Motion	Handles the finer motion: the reveals, the number count-ups, the navigation highlight, the small touches.
Vercel hosting	Fast, secure hosting. The site is yours to own outright, with no monthly platform rent.

IN SHORT

Built to your brief, and to a standard I am proud to put my name to.

This is a slice of the site, built in days. The rest is more of the same, and beyond the build there is a partnership: keeping it refined, tracked and quietly bringing you booked calls. Whenever you are ready, I would love to build the rest.
